Trace*Risk*

AI-Assisted Domestic Travel Awareness Dashboard for India

One dated, evidence-linked briefing before you go.

STEP-BY-STEP PROJECT BRIEFING

Good journeys start with better *context.*

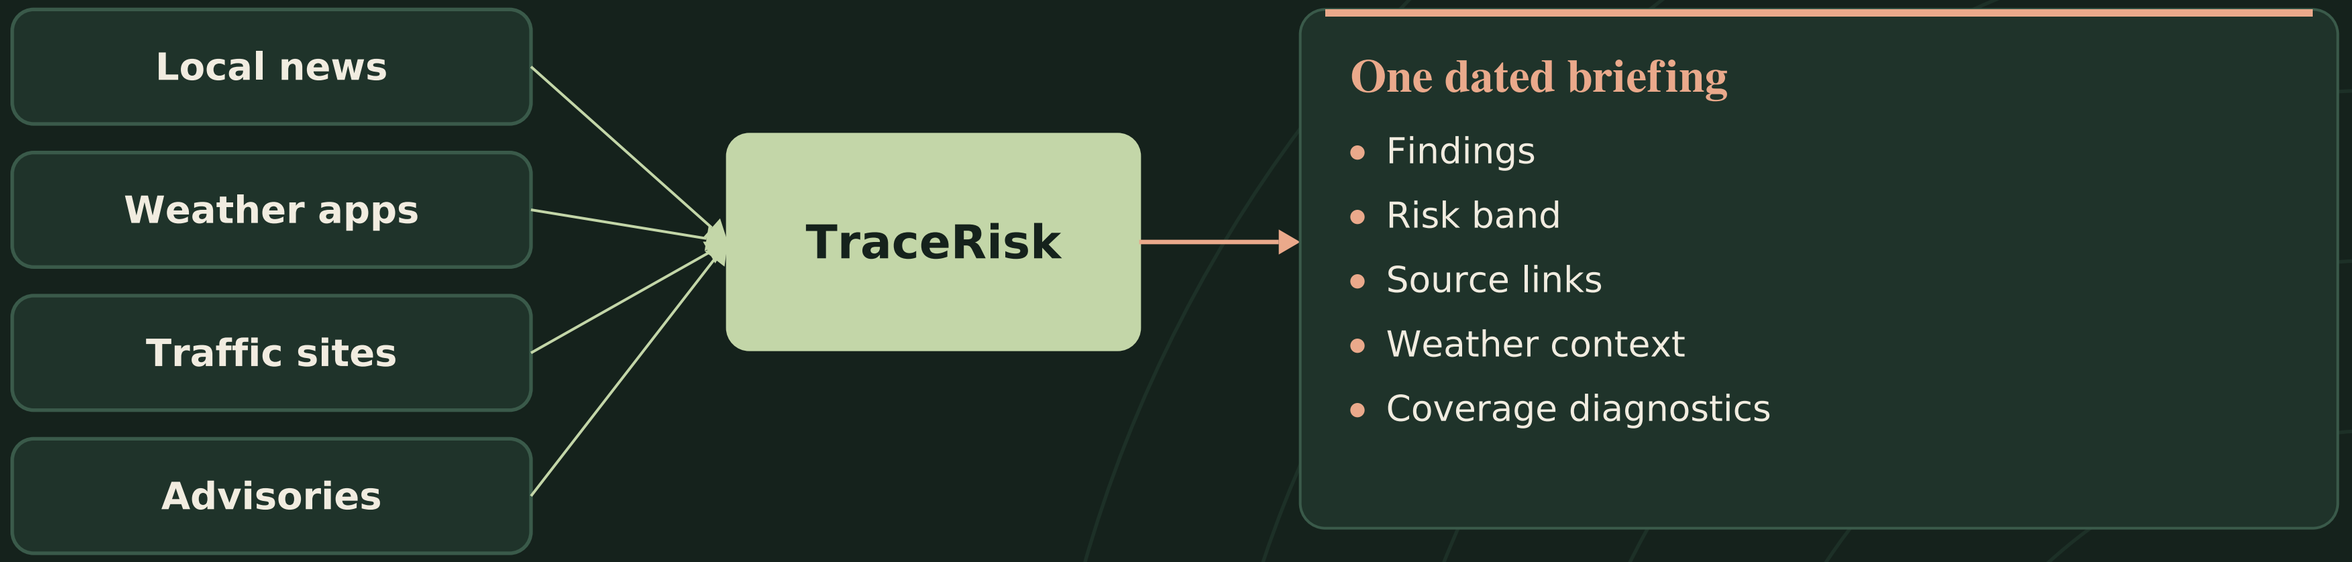

What is TraceRisk?

TraceRisk is an AI-assisted travel-awareness dashboard that helps travellers make informed decisions before exploring India. It brings together destination- and date-specific insights from news, transport, weather, and official advisories.

By analysing eight key risk categories, it highlights potential concerns, supporting sources, and a heuristic risk score. TraceRisk simplifies travel research and encourages better preparation, while travellers should always verify critical updates with official sources.

Why *TraceRisk*

Scattered, date-sensitive signals become one briefing.

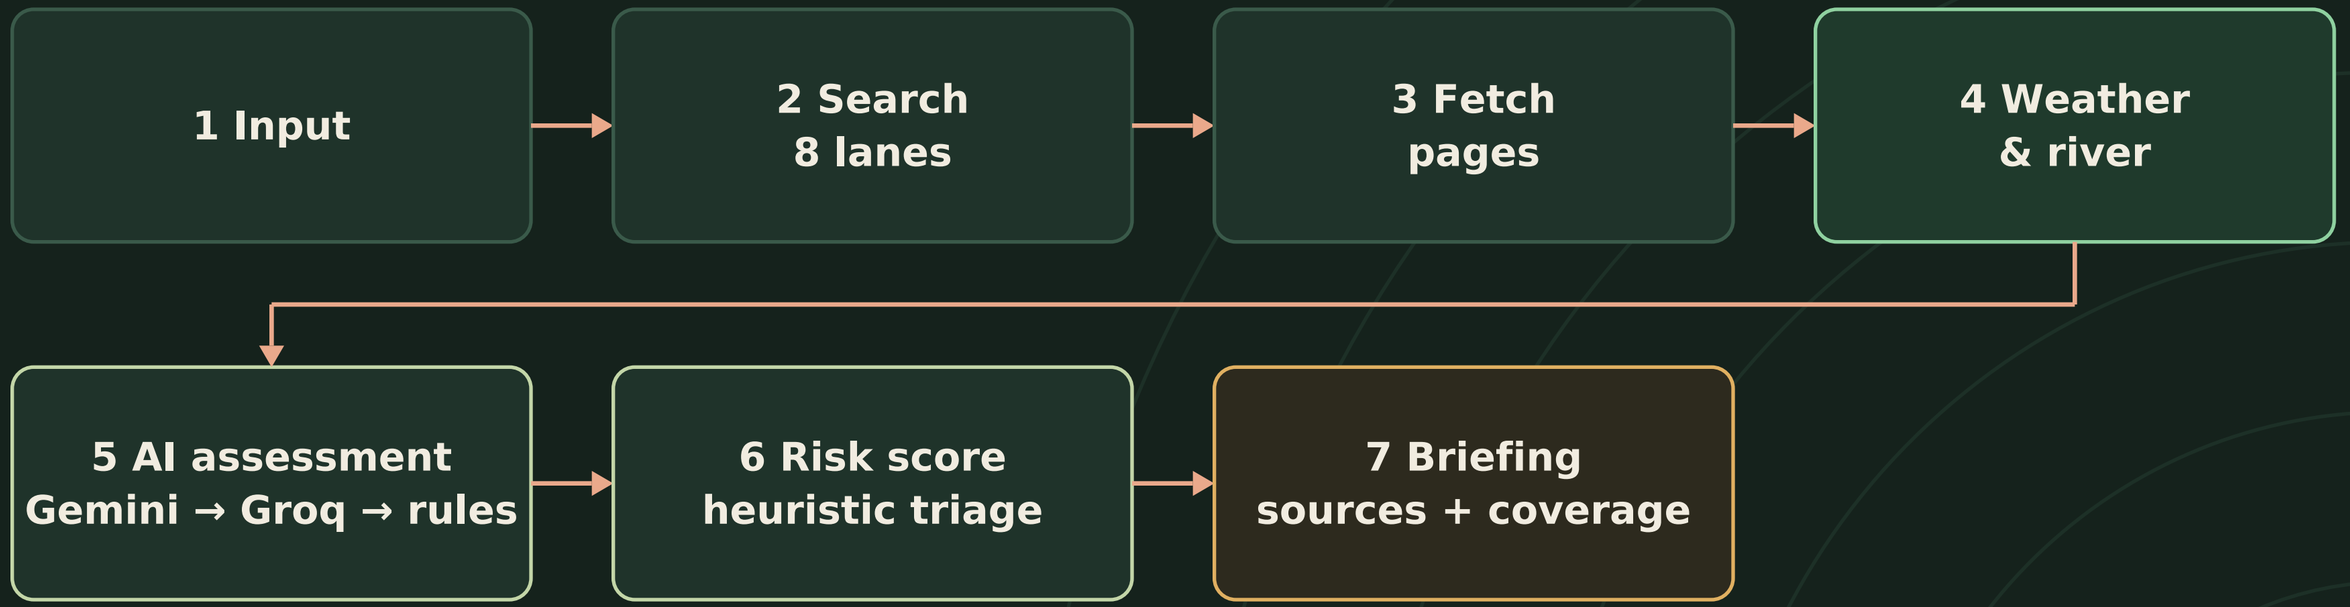

Principle: No issue found does not mean proven safe. Coverage and uncertainty travel with the result.

OVERVIEW

End-to-End *Pipeline*

Seven stages from trip details to briefing.

Weather runs alongside web search; the AI step reviews both together.

STEP 1

Input

Destination and dates anchor every later step.

DESTINATION

START DATE

END DATE

Express
/api/analyze
(React/Vite → API)

Open-Meteo geocoding
→ coordinates, then search & weather start together

Why it matters

- Dates scope forecasts, discharge and relevance
- One precise place gives a less stale briefing

Caveats

- Ambiguous names need stronger disambiguation
- Weather/river coverage varies by region

STEP 2

Search: 8 *Lanes*

Targeted discovery through TinyFish Search.

- Traffic & roads
- Public transport
- Civil unrest
- Official advisories
- Health
- Crime
- Infrastructure
- Regional news

Processing core: select usable URLs · deduplicate · balance sources

Targeting

- Freshness and domain filters per lane

Limits

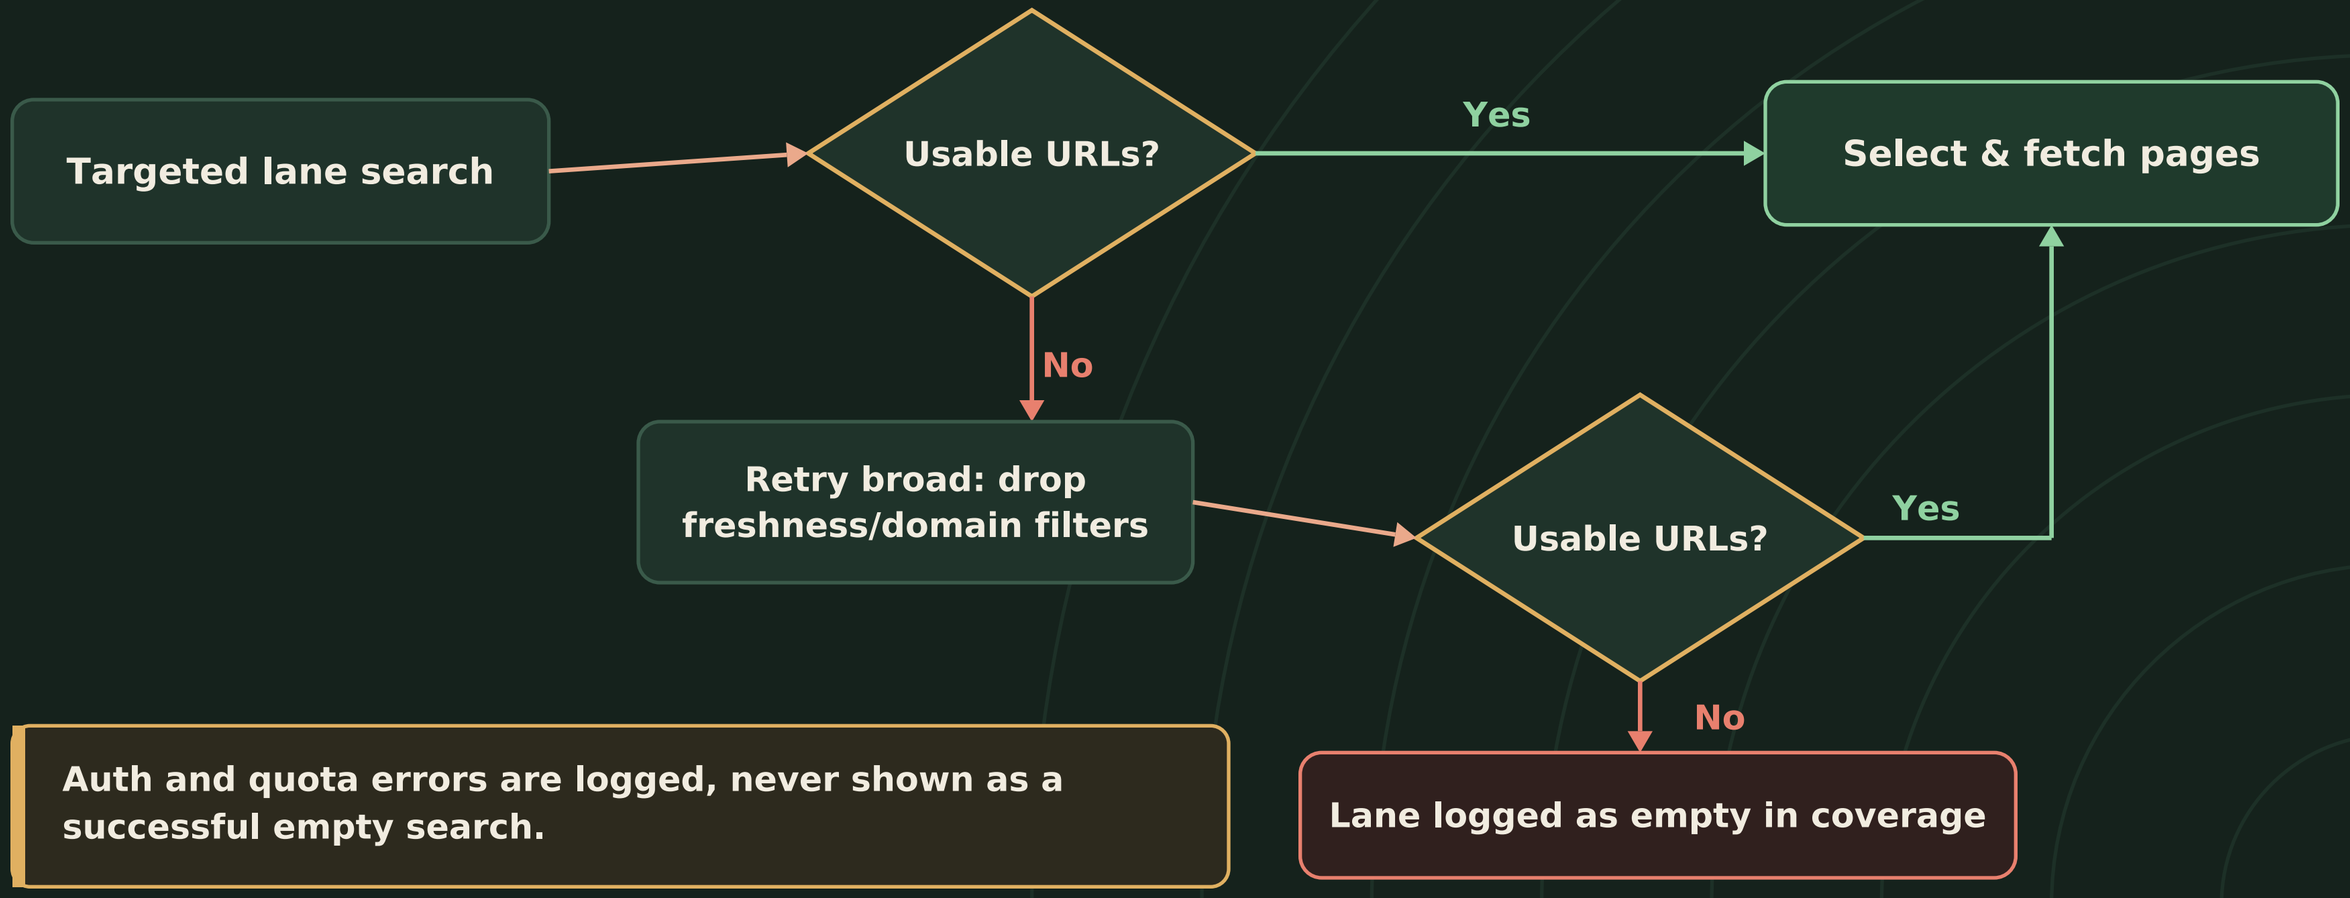

- Indexes may miss new or local-language reports

A quiet lane is not evidence of safety.

STEP 2

Broad-Query *Retry*

How an empty lane is handled.

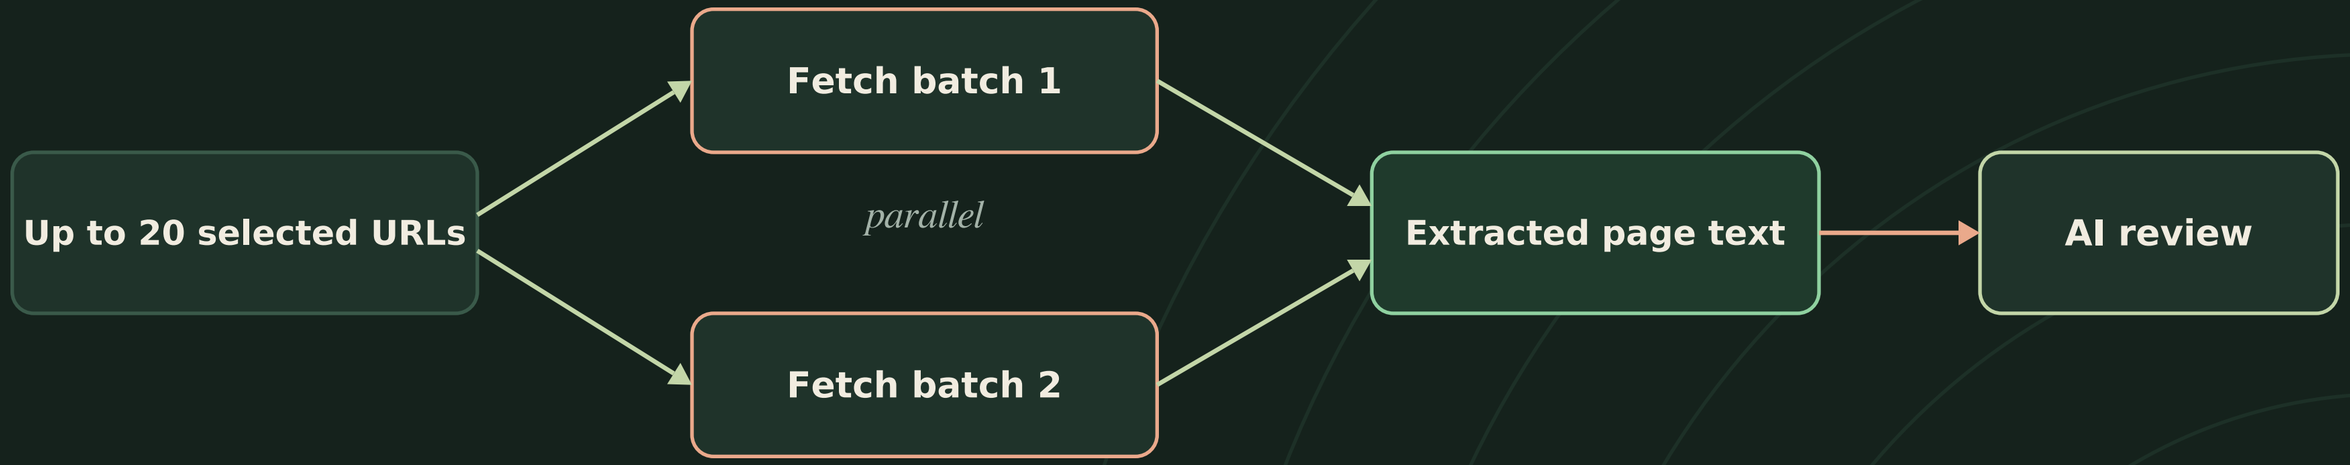

Auth and quota errors are logged, never shown as a successful empty search.

STEP 3

Fetch & *Extract*

Turning search hits into readable evidence.

Selection

- Dedupe; balance sources

Evidence

- Each finding keeps its source link

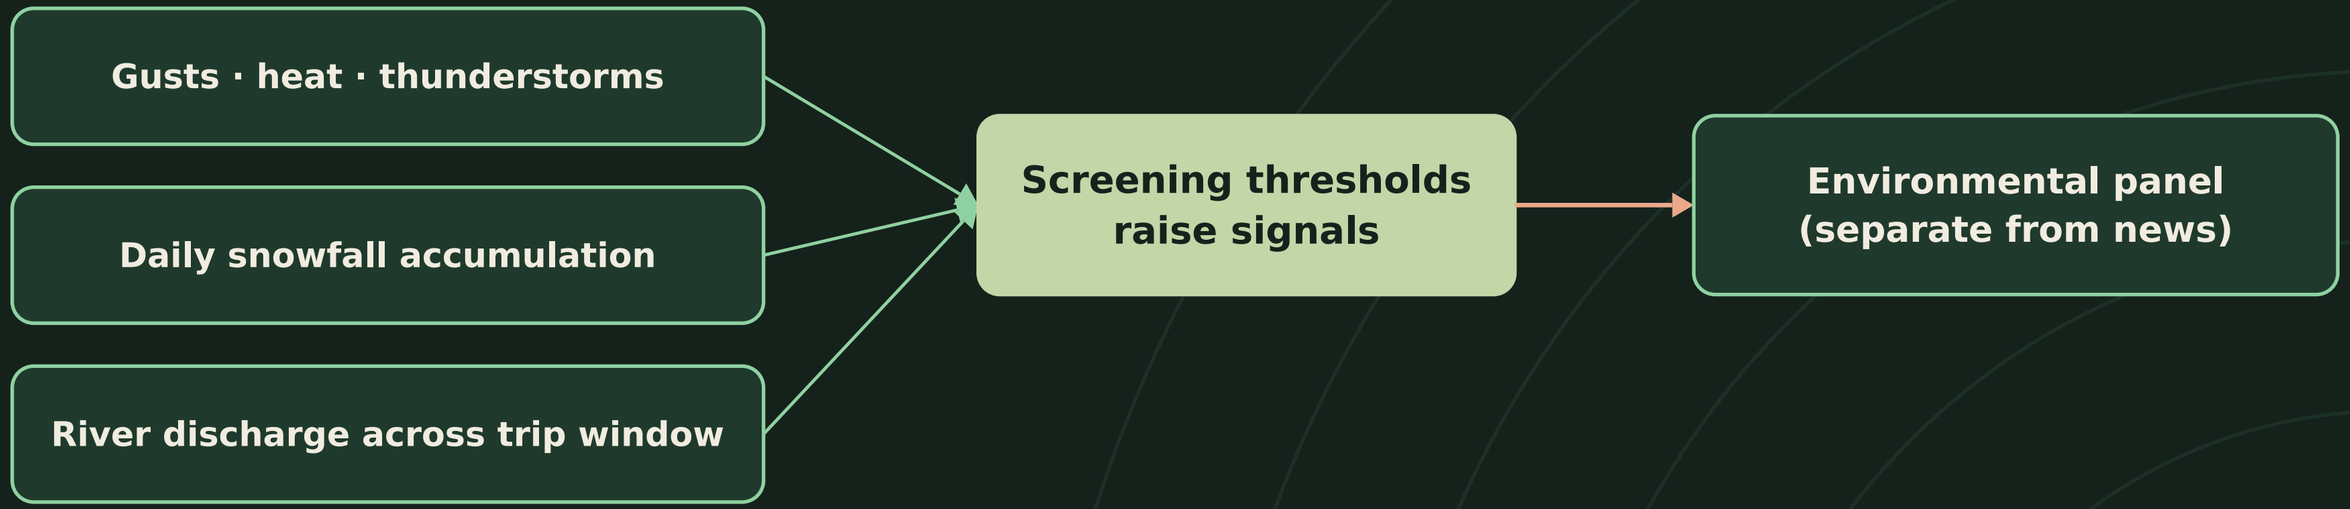

Limits

- Fetch failures; date handling

STEP 4

Weather & River *Data*

Open-Meteo context, shown apart from news.

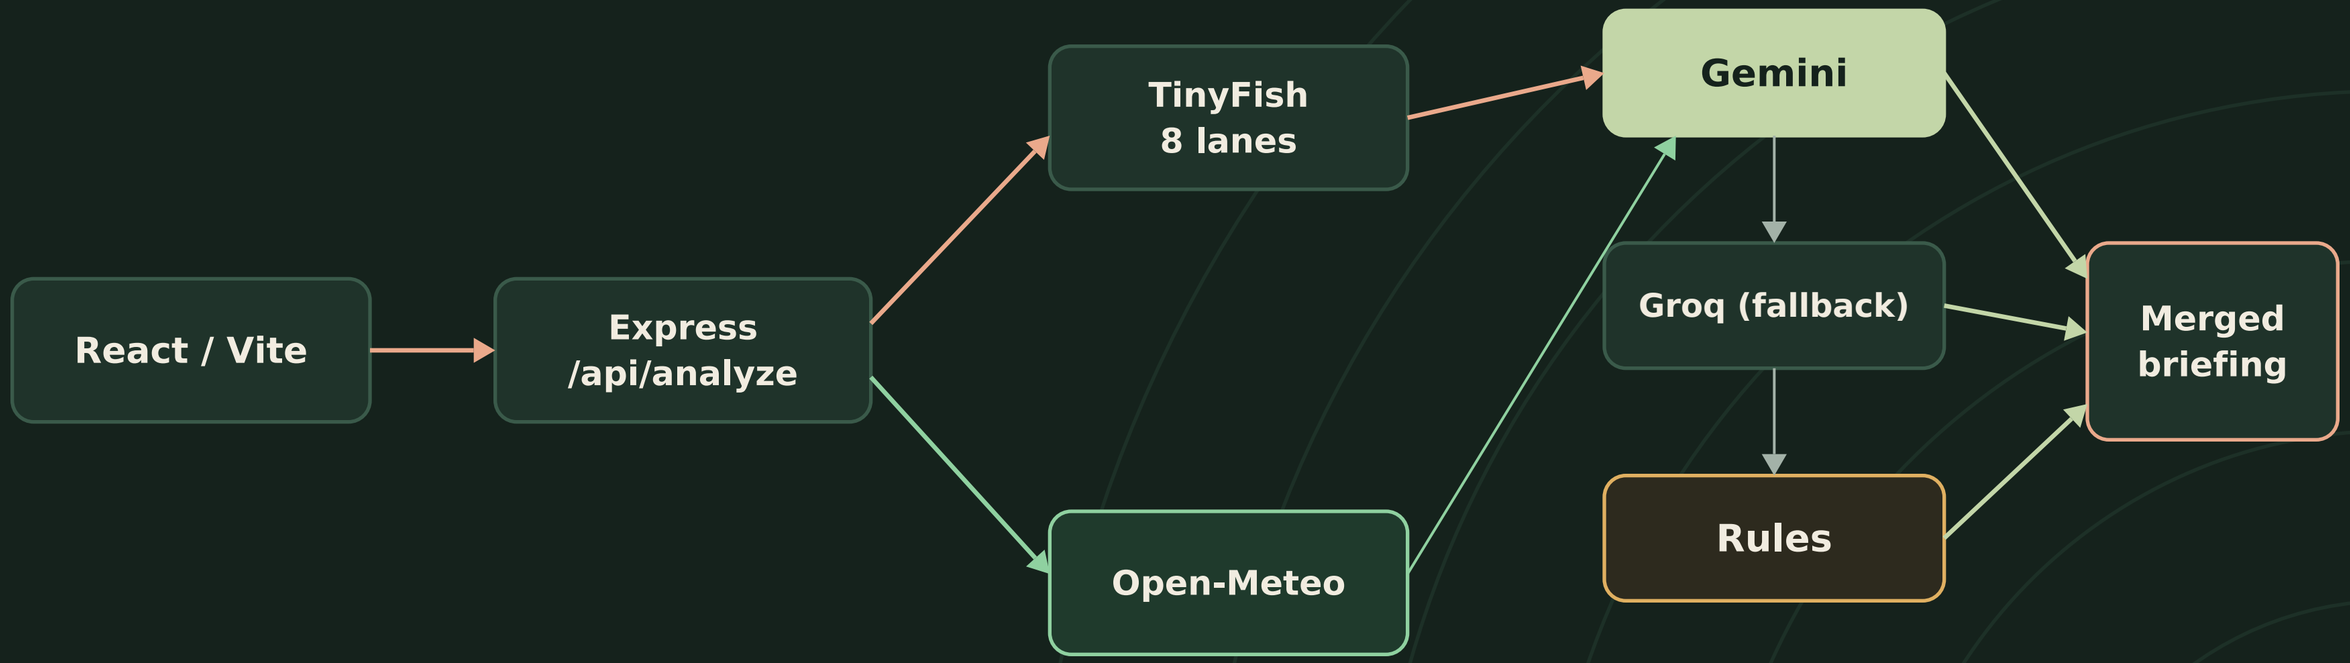

System integrity boundaries

- Forecast-derived signals are NOT official warnings; missing weather data is never 'safe'

Architecture & *Fallback*

Redundancy guarantees a result.

If the primary AI is unavailable, the system routes down the chain: Gemini → Groq → deterministic rules.

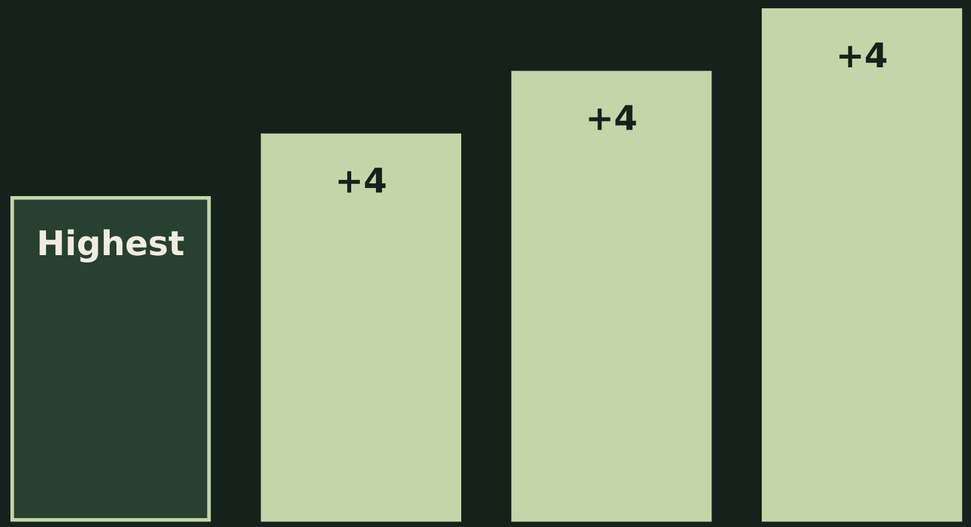

STEP 5

Risk *Score*

A heuristic triage summary, not a probability.

```
Overall = min(100, highest_issue + 4 × (issues − 1))
```

CAP: 100

0–34 Low signal

35–59 Elevated

60–79 High

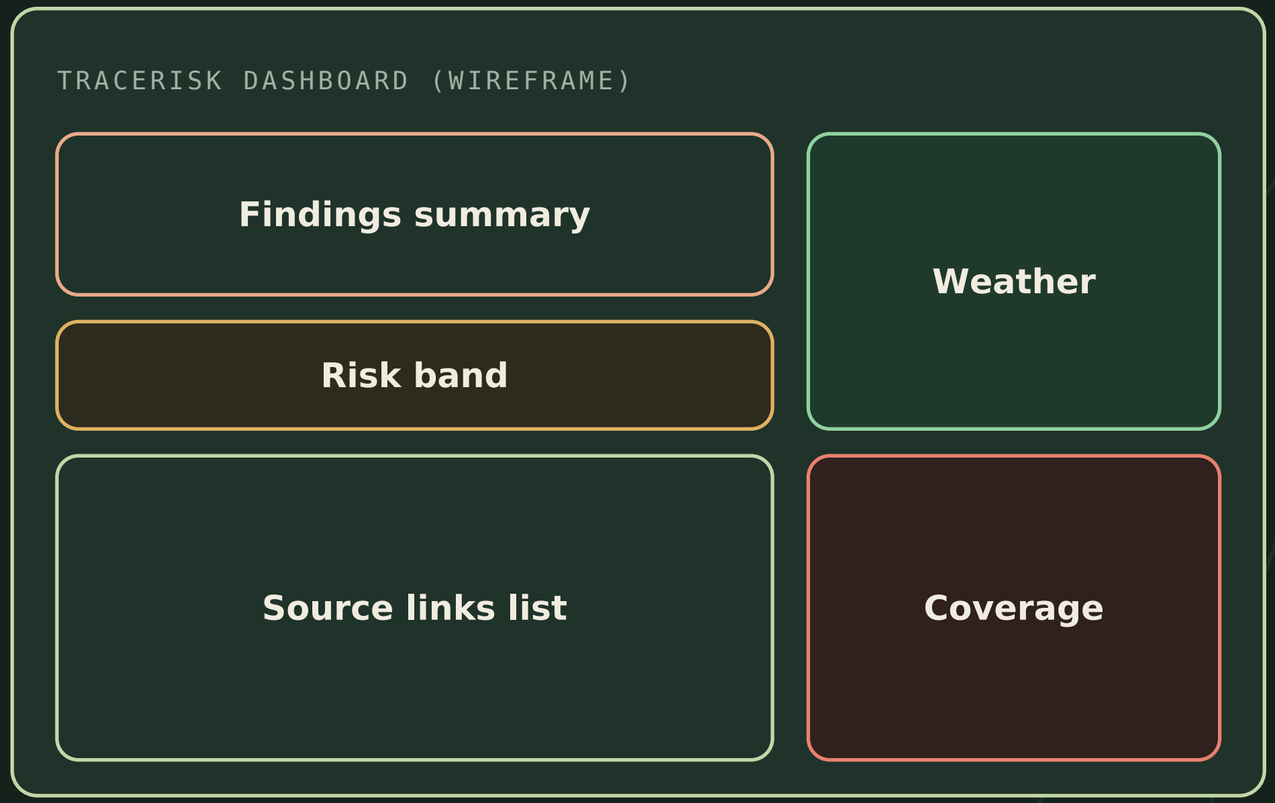

80–100 Critical

Not calibrated or official. A score of 0 is NOT proof of safety; issue scores come from AI or fallback rules.

STEP 6

Briefing & *Coverage*

What the traveller sees.

1. Findings summary, or lack thereof
2. Risk band: heuristic severity
3. Source links to inspect reports
4. Weather and river context
5. Coverage: what was and wasn't checked

Inconclusive evidence is never presented as an all-clear.

Users, Value & *Demo*

Who it helps and how to show it.

Solo & family travellers	**Less context switching**
Students & first-timers	**More inspectable findings**
Multi-stop trip planners	**Earlier questions to ask**

2-MINUTE DEMO PATH

1. **Enter destination & dates**
2. **Run live scan**
3. **Open a source link**
4. **Check score & coverage**

Limitations & *Roadmap*

Honest limits today, concrete next steps.

Current limitations

- Search may omit new or local-language reports
- Outages, quotas and timeouts reduce coverage
- Weather/river data have geographic limits
- AI findings are not independently verified
- Score is a heuristic triage indicator

- Automated tests: scoring, dedup, failures
- Evaluate retrieval on historical incidents
- Freshness and publication-date checks
- More languages, location disambiguation
- Caching, rate limiting, observability
- Improvement in 0-100 scoring system

Roadmap: Monetisation & *Booking*

From a safety briefing to a safe, bookable trip, without compromising the risk score.

Safe-area hotels

- Recommend stays in zones with a low signal for the dates searched
- Affiliate commission per confirmed booking
- Each pick links to its risk evidence

MakeMyTrip integration

- Deep links pre-filled with the destination and dates entered
- Flights, trains, buses and tickets
- Referral revenue per booking

Uber rides

- Airport / station to hotel ride links
- Route-aware: avoid areas flagged in the briefing
- Referral income on first rides

Matching theme

- Dashboard and slides follow the website's field-guide theme
- One brand across web, reports and shared briefings
- Light and dark modes

Principle: partners never influence the risk score. Affiliate links are disclosed; picks are ranked by safety evidence first.

TraceRisk

TRAVEL SMARTER. STAY SAFER.

Thank *You!*

Safer journeys start with better information.

Thank you for your time and attention.
