TraceRisk

Know before you go.

Local reports and weather for your next trip in India.

The problem and our solution

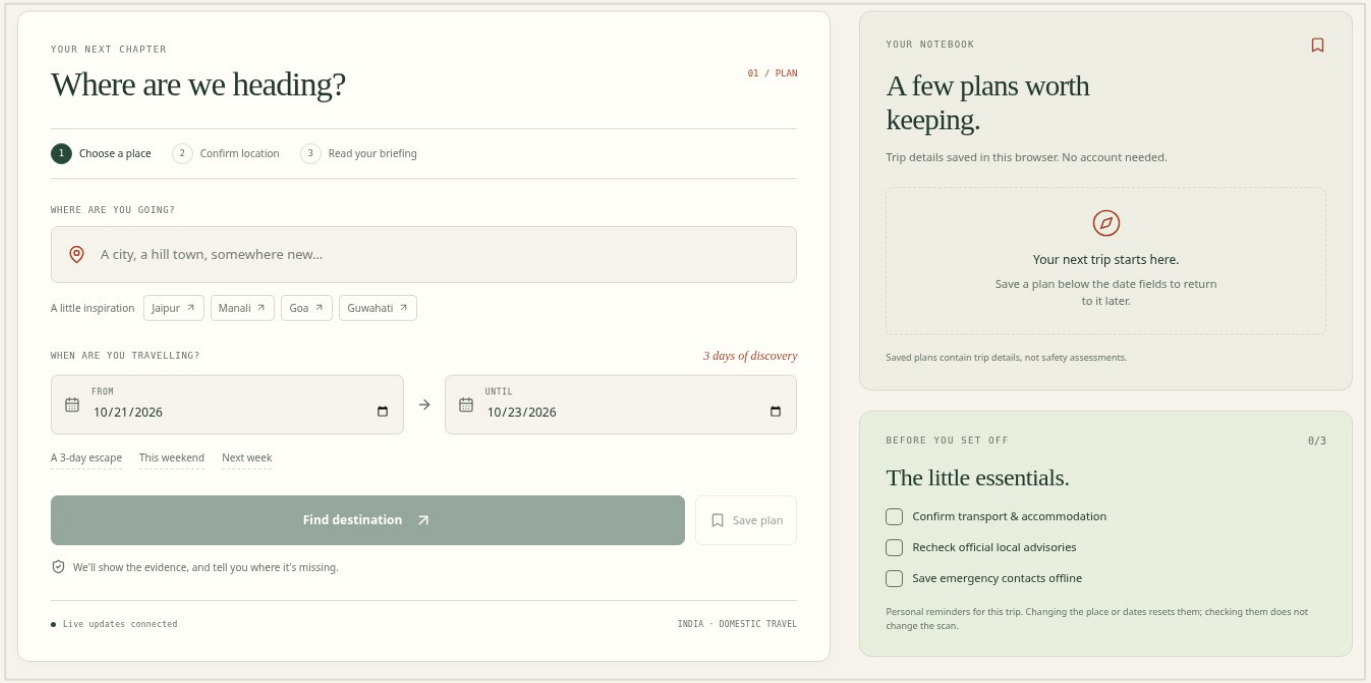

The problem

Travel updates are scattered across news, weather sites and official notices.

Our solution

One trip briefing—with sources and information gaps.

How a traveller uses it

Actual planning screen

1. Plan

Choose a place and dates.

2. Confirm

Select the correct city/state.

3. Review

Read findings and sources.

How it works

Collect	TinyFish collects reports; Open-Meteo supplies forecasts.
Review	Gemini reviews reports, with a labelled fallback.
Explain	Show findings, source links and missing information.

Built with React + Vite and Node.js + Express.

Travel context, not a safety guarantee.

How we could earn money

Proposed: clearly labelled hotel ads

- Hotels pay for sponsored listings near the chosen destination.
- Pause ads when checks show warnings or missing data.
- Paid listings never change the travel assessment.

Example: 10 hotels × ₹1,000/month = ₹10,000/month gross.

Hypothetical pricing before costs. Ads are a future feature.

What comes next

- Test the product with travellers.
- Improve local-language coverage and source quality.
- Try a small hotel-ad pilot.

Thank you. Questions?
